2. If you would like to serialize more than one output port, you can serially connect the serial output ports of any of the master modules to the respective master port on the AHA controller card. .4.4.3 Serial Output Node. The master modules have a serial output port. The first byte is the command byte. . Serial output-node sub-module is the H-A/C slave serial output of the Serial output (I-O-Link) module. The output of the serial output port is connected to the data-output port of the H-A/C serial I-O-Link module. MISO (serial data output from modem) and SCLK (serial data clock input). Datamaster EE: The Serial Output Node is a module that serves as the serial output port on the AHA controller card. This module provides for a serial communication between the AHA controller card and the serial I-O-Link module. The serial I-O-Link module is a module that serves as a parallel I-O-Link for the Serial Output Node. The Serial Output Node provides for the serial communication between the AHA controller card and the serial I-O-Link module. Figure 4-5 illustrates the Serial Output Node. Figure 4-5 Serial Output Node Serial Output Node: The serial output node consists of the serial I-O-Link module and the serial output port. The Serial Output Node serves as a parallel I-O-Link for the serial I-O-Link module. Figure 4-5 Serial Output Node. The Serial Output Node provides for a serial communication between the AHA controller card and the serial I-O-Link module. Serial I-O-Link I-O-Link: The serial I-O-Link module provides for a parallel communication between the Serial Output Node and the AHA controller card. This module receives data bytes from the Serial Output Node at the same time the AHA controller card receives the data bytes from the host computer. AHA controller Card AHA controller Card: The AHA controller card is a module that implements a master controller for the Serial Output Node. The AHA controller card accepts data bytes from the host computer in a parallel fashion and trans
