Ensuring portability: 3G However, this does not imply that users can use the Internet on their mobile phones without first connecting to a mobile internet network. The mobile networks need to be able to transmit data across large distances, and thus are necessary to the 3G technology. Some countries might require further specifications. In these countries, 3G signals are usually transmitted on very high frequencies, which can interfere with other devices, most notably with devices using WiFi. Moreover, 3G signals have lower bandwidth than WiFi signals. Transmission power: 5-15W Smart phones are small devices, with very low power consumption compared to laptops and desktops. Their battery can't be used for long periods of time, so manufacturers put on them smaller and less powerful CPUs, but they still require the electric power to work. The main purpose of a power pack is to supply electricity to the smart phone, allowing it to work. Some devices include one single power pack, while others include two. These power packs come in different sizes, but can vary a lot in size. The smaller the battery, the smaller the power pack can be. Many smart phones have small power packs built into the device, which can draw a small amount of energy from a regular battery that is already inside the device. This is one of the reasons why the small packs can charge smart phones several times, whereas other power packs can only recharge one 70238732e0

Since 1990, research has been focused on the relationship between air pollution and respiratory diseases. In many studies, the correlation between respiratory diseases and air pollution has been evaluated. In this study, we conducted a systematic review of the literature in an attempt to determine the association between respiratory diseases and air pollution. We reviewed data published up to June 2006 in PubMed and MEDLINE databases. The review process identified 5,972 relevant citations, of which 612 were included in the final review. We found 7 types of studies. Four out of seven studies showed that respiratory diseases are associated with air pollution. This evidence was derived from: (a) two cohort studies, which showed that ambient air pollution was associated with increased risk of developing respiratory diseases in exposed populations; (b) two cross-sectional studies, which demonstrated an association between respiratory diseases and levels of air pollutants in the same communities; and (c) one case-control study that showed that gas- and particulate-bound pollutants were associated with respiratory diseases. The remaining three types of studies, namely case reports, reports, and meta-analyses, did not support an association between respiratory diseases and air pollution. There is a strong association between air pollution and respiratory diseases.
