

Odd it wasn't on the first page of results. Ended up here after a Google search, though. Bummer. Selective changes in catecholamine turnover in different cerebral regions of the gerbil following acute deafferentation of the superior colliculus. The turnover of dopamine (DA), norepinephrine (NE), and 3,4-dihydroxyphenylacetic acid (DOPAC) was estimated in different cerebral regions of the intact gerbil and of the gerbil whose superior colliculus had been unilaterally removed 1 week prior to collection of the tissues. After unilateral superior colliculus removal there was an increase in NE turnover in the substantia nigra but no change in DA turnover in this region. There was a decrease in NE turnover in the cerebral cortex and in the hippocampus and an increase in NE turnover in the substantia nigra after unilateral superior colliculus removal. In contrast, DOPAC turnover was unchanged in the substantia nigra, but there were decreases in DOPAC turnover in both the cerebral cortex and the hippocampus after unilateral superior colliculus removal. These results suggest a selective increase in NE turnover in the substantia nigra following unilateral superior colliculus removal and a decrease in NE turnover in cortical regions and in the hippocampus. Q: Deciding which image to load by URL I have images in multiple sizes, and want to display whichever is suitable for the user's device (mobile vs desktop) to scale and fit. At the moment, I'm currently using the following: if ( \$this->img\_width > \$this->img\_height ) { // only load portrait image \$img = \$this->get\_desktops\_resize(); } else { // only load landscape image \$img = \$this->get\_mobiles\_resize(); } The images are then displayed using this: "> As you can see, this is all done in one go. However, I'm not sure how to go about doing this if I had a list of all of the images to select from. Is this something that is possible to do? Or do I have to manually do this for every image? A: You can create an array of paths and then loop through
