Category:VSTQ: How do I write a query with a JOIN on two different tables in a subquery? I have these two tables Table1 ID Name Date 1 ABC 2013-02-18 Table2 ID Name Date 1 ABC 2013-02-18 2 XYZ 2013-02-18 3 DEF 2013-02-18 I want to select the rows from Table1 and join it with Table2 as shown below Table1 ID Name Date Table2 1 ABC 2013-02-18 2 I tried this: SELECT Table1.ID, Table1.Name, Table1.Date, Table2.Name FROM Table1 INNER JOIN Table2 ON Table1.ID = Table2.ID But it doesn't work. Please help me. A: Use LEFT OUTER JOIN SELECT Table1.ID, Table1.Name, Table1.Date, Table2.Name FROM Table1 LEFT OUTER JOIN Table2 ON Table1.ID = Table2.ID INNER JOIN means that you require a match for each record. So if you only join on ID, the Table2 record will not be returned, even if there is a match. LEFT OUTER JOIN means that you require a match, even if there is not a match for each record. The Table2 record will be returned. 4bc0debe42
