AutoCAD is available as both an independent drawing program and as a plugin for other software packages, allowing users to import and export AutoCAD drawings. In 1985, Autodesk released a comprehensive CADD or CAD-Drafting Solution of the early 1980s called AutoCAD. It was a commercial product for the IBM PC compatible. AutoCAD is similar to MicroStation, a popular CAD software package from Bentley Systems that was also released in the late 1980s and early 1990s. The product has become a popular tool used for many different applications from CAD and drafting to 3D modeling, documentation, reverse engineering, mechanical engineering, and visualization. It's used by architects, engineers, and construction firms for creating schematics, floor plans, and structural and electrical diagrams. Additionally, it has been used as a tool for building 3D models of stadiums, houses, and other structures. In 2011, Autodesk announced that it would be expanding the capabilities of

AutoCAD. These developments have involved the introduction of new versions of AutoCAD. Autodesk used a new naming scheme for AutoCAD releases, starting with version 12, and it has used a three-number version system for releases. The numbers indicate the year in which the release was announced.

AutoCAD Architecture and Function Every

AutoCAD feature has a name, which you can see in the Property Palette. These names have been organized into feature categories. The following is an example of a list of a few features that are available in a standard AutoCAD drawing.

Selection: The Selection features allow the user to select a single object or an entire drawing by using the mouse and dragging the pointer.

Drawing: The Drawing features allow you to create and modify drawings. It includes features for inserting, cutting, and pasting objects. Additionally, it contains tools for creating new layers and working with 2D and 3D elements.

Dynamically-Changing Objects: The Dynamic-Changing Objects features allow you to create, modify, and delete groups of elements in a drawing by using the mouse.

Construction Tools: The Construction Tools features

allow you to add text, dimensions, grids, and other 2D and 3D shapes to your drawing. **Layout and Styles:** The Layout and Styles features allow you to position, resize, and change the appearance of your objects.

packages1. Field of the Invention The present invention relates to a method of and an apparatus for manufacturing a large-scale integrated circuit device, or more in particular to a method of and an apparatus for forming a pattern. 2. Description of the Prior Art In manufacturing a large-scale integrated circuit device, a pattern forming technique is often employed for forming a pattern of a conductor, such as a metal, with high precision. FIGS. 1A-1E show a pattern forming technique in the prior art. FIG. 1A shows a fragmentary sectional view of a semiconductor substrate 1 on which a pattern of a conductor is to be formed by using a photolithographic technique. The semiconductor substrate 1 has a silicon dioxide layer 2 as an insulating layer and a conductor layer 3 such as a polycrystalline silicon layer, which has impurities diffused therein and is formed on the silicon dioxide layer 2, a photoresist 4 as an exposure material, a resist frame 5 as a mask for the photoresist 4, a photo mask 6 as an exposure material and an

exposure light source 7 for irradiating exposure light on the photo mask 6. FIG. 1B shows a pattern forming method according to the prior art. A resist layer (not shown) is firstly formed on the conductor layer 3. The resist layer is patterned by exposing the resist layer to light through the photo mask 6 and subsequently developing the resist layer to leave a resist pattern 8 on the conductor layer 3. The resist pattern 8 is then used as an etching mask to etch the conductor layer 3. a1d647c40b

Plasma and sputum concentrations of tenidap in the treatment of patients with active tuberculosis. Tenidap (6-(3-methyl-2-thiazolyl)-1-methyl-1,2,4-triazin-3(2H)-one) is an orally active, non-steroidal anti-inflammatory drug which is also approved for the treatment of rheumatoid arthritis. Its mechanism of action is unknown. In this study, the disposition of tenidap was examined in seven patients with active tuberculosis and three control subjects. Patients and controls received 600 mg oral doses of tenidap at the peak concentrations of 600 mg.h⁻¹ in plasma. The patients were receiving concomitant antituberculosis chemotherapy with isoniazid, rifampicin, pyrazinamide, and ethambutol. Blood samples were drawn up to 48 h post dose, and sputum was obtained at 24 and 48 h post dose. Tenidap and its primary metabolite, 3-(3-methyl-2-thiazolyl)-1-methyl-1,2,4-triazin-3(2H)-one (M1), were

measured by high-performance liquid chromatography. Plasma concentrations of tenidap were determined using a validated, sensitive and specific reverse phase high-performance liquid chromatography method. Plasma concentrations of tenidap and M1 increased rapidly following drug administration. After 24 h, mean (\pm SD) plasma concentrations of tenidap and M1 were 163 \pm 22 and 5.7 \pm 3.7 micrograms.ml⁻¹, respectively, in patients, and 146 \pm 56 and 2.9 \pm 1.9 micrograms.ml⁻¹, respectively, in controls. Mean (\pm SD) sputum concentrations of tenidap and M1 at 48 h post dose were 0.6 \pm 0.3 and 1.3 \pm 0.9 micrograms.ml⁻¹, respectively, in patients, and 0.7 \pm 0.4 and 0.8 \pm 0.3 micrograms.ml⁻¹, respectively, in controls. Plasma and sputum concentrations of tenidap at 24 and 48 h were significantly (P
