If you are satisfied with 7-zip then you will never go for other solutions. In electrical and electronic equipment applications, it is often desirable to use a double insulated flexible circuit for connecting electronic devices to printed circuit boards. A double insulated flexible circuit includes an insulated base or substrate, an outer layer, and an inner layer of insulation. The outer and inner layers typically form a sandwich, or a concentric stack of two insulated layers. The outer layer (sometimes referred to as the outer insulating layer) provides for the mounting and handling of the flexible circuit and can be a woven material, or polyester film. The inner layer of insulation is a flexible sheet or film of polyethylene terephthalate (PET). The inner layer is joined to the outer layer and provides electrical insulation between electrical conductors, such as copper. In order to connect the flexible circuit to electrical components, the flexible circuit is inserted into a plated hole in the printed circuit board. A single conductive tab is located on a surface of the flexible circuit and is connected to a surface of the flexible circuit that is opposite from the flexible circuit that is inserted into the plated hole. An end user may use a flex circuit that is connected to electrical components to connect electronic devices to printed circuit boards. For example, the end user may connect a personal digital assistant (PDA) to a printed circuit board using the flex circuit. Typically, the end user uses a double insulated flex circuit that includes a tab. The tab is a single conductive tab that is connected to a single conductive point. The single conduct 1d6a3396d6
