Hexadecimal of the day: Be sure to enable any hashing options you want to use, for example MD5. Here, we explain why you might not want to use a hashing algorithm. HexadecimalToday, MD5 is definitely not commonly used. It's quite easy to break MD5, but it is not even practical to break it. It was originally made to function as a replacement for the commonly used, and unbreakable, MD4, but was a bit slower (for non-crypto applications). According to McAfee's list of cryptosystems, MD5 is the "most widely used cryptographic hash." However, MD5 has been found to be vulnerable to a number of different cryptographic attacks and has therefore become widely regarded as being a "one-way" hashing function. Because MD5 is relatively easy to break and slow, it is not commonly used as a hashing function. Some websites and online storage services may want to avoid this as they do not want to use a hashing algorithm that is easy to break or too slow. If you are working on a desktop or laptop, you can disable the MD5 hashing algorithm on that system. If you are working on a server, you cannot do this, as it would have a negative impact on the entire network. Instead, you will need to use a different hashing algorithm. Tip: The most common alternatives to MD5 are SHA1 and SHA2. We encourage you to use SHA2 or SHA3 as they are newer and can be broken more easily. Video about

KEYMACRO is a command-line tool to manage, view and search for all key-related files on a system, including Windows passwords, Internet Explorer keys, certificates, etc. The KEYMACRO user interface contains two areas: * Search: In this area, one can search for any key-related file on the system. The search works the same way as in a traditional Windows search

program, searching through the hard disk (keyword+wildcards) or on the network (domain names, user names, passwords). * Contents: This area lists all key-related files found by the program's searches. Extracts from file.txt: 1: This is my first key 2: This is my second key ... Keymacro contains a generic search engine and a detailed view of files containing any key-related data (including Windows passwords). Keymacro supports the following data types: * Network (domain names, user names, passwords): Identifies network objects (domain names, user names, passwords), with the option to run a security test (see below). * File: Identifies all key-related data in any file (includes passwords), and runs a security test if a file containing keys has been identified (see below). * Registry: Identifies registry objects (keys, values, etc), and lets one view the complete registry, sorted by data type and location, and extract each key or value. * Crypto: Identifies all Windows cryptographic keys, which is useful for performing security audits of Windows-based systems. This option also lets one automatically extract keys from the Windows Registry. This tool is released under GNU/GPLv3 License. Keymacro on SourceForge.net 2. Installation Keymacro can be installed on Linux, Windows and Mac OS X systems. For Linux users, Keymacro's application program files ("APP") can be found in /opt/Keymacro. For Windows users, it is recommended to put the APP files in the default Program Files directory. For Mac OS X users, it is suggested to move the APP files to the Applications directory. 3. Requirements Keymacro can run on all 64-bit versions of Linux, Microsoft Windows (2000, XP, Vista, 7) and Mac OS X (10.4 and above). 4. Usage Keymacro contains a generic search engine and a detailed view of files containing any key-related 1d6a3396d6

HashZilla is a unique freeware which analyses the integrity of files and subfiles transferred over the Internet, using several crypto-algorithms to protect the file in the case of tampering. Its main features are: Integrity Check: The software checks the integrity of a file using the SHA1, SHA224, SHA256, SHA384, SHA512, MD5, CRC32 and ADLER32 algorithms; all of which have been set as a default. It can also perform integrity checks on subfiles, such as images, audio or video files. Delayed notification: As soon as an integrity check is performed on a file, HashZilla will send a notification to its dedicated e-mail account. HashZilla can be employed for 3 main uses: Files integrity check: HashZilla can be employed to check the integrity of any document or subfile, as well as to protect them against corruption. Numerical vs. hexadecimal representation: HashZilla allows the user to switch between a numerical and hexadecimal format, allowing for a better view of hashes, even if both are displayed in different columns. Hash-based password comparison: HashZilla can be used to compare passwords or other elements such as MAC addresses and CRL certificates, based on the hashes of the corresponding data. Buy HashZilla safely through the one of the best hosting Providers: Softaculous! Facile one-pot synthesis of well-defined multilayer silica-supported carbon sheets. Multilayer carbon sheets with numerous interconnected carbon nanofoams were successfully synthesized on silica gel. The formation mechanism was explored via a one-pot hydrocarbon-free method using cyclopentadiene as a carbon source and a stabilizing agent. The resulting carbon nanofoams were tightly covered by dense sheets. The sheets consisted of crumpled carbon nanofoams, which were supported on silica gel and had a large specific surface area of 3454 m² g⁻¹. Q: MySQL nested select query on one field containing multiple values I have a table which looks like this: | UserID | UserName | |-----|-----| | 1 | John Doe | | 2 | Bob Bias | I want to get a list of all users who have an entry for the UserName 'John Doe' or 'Bob Bias' which is stored in the UserName field of that table. In this example, UserID
