Although there are no general guidelines for  
the treatment of hematomas, the use of minimally invasive  
techniques in the treatment of emergency surgery is still an

recovery rate between the surgical and conservative treatment groups. However, the recovery rate of the conservative treatment group was higher than that of the surgical treatment group. Hydrocephalus and brain herniation are devastating conditions \[[@CR23]\]. In addition, the recovery rate of the conservative treatment group was very high. However, there was no significant difference between the two groups in terms of the recovery rate. Therefore, a conservative treatment approach could be considered for patients who have not increased in ICP after the drainage of the hematoma and have normal a1d647c40b
